Q&A from our Facebook Group
Calling attention to helpful posts

Can there be more than one settings profile in Loop?

See what our experts said.

Here's another of this week's many great questions on FB:

When I eat carbs for a low, should those carbs be entered into Loop?

See what our experts said.

Enhancements to Loop's
Profiles
Customization

Our Profile feature, crafted to swiftly save and transition between therapy setting subsets tailored to your needs, has received a significant upgrade. Thanks to your invaluable feedback, here's what's new:

- **Active Profile Indicator**: Quickly identify your current profile with a clear checkmark.
- **Manual Profile Sorting**: Organize your profiles exactly how you want them.
- **Profile Update Alert**: Made changes to your therapy settings? Loop will now suggest updating your profile. Alternatively, save these new settings as a separate profile.
- **Profile Renaming**: Regret the initial name? Now you can change to a new one.

How to Upgrade
The update process varies based on your build method:

- **Browser Build**: If you've already incorporated the Profiles customization, simply rebuild to access the latest version.
- **Mac-Xcode Build**: Execute the Build-Select Script, choose "Customization Select", and an update option will be presented.

Note: This customization is compatible with both Dev and Main versions of Loop.
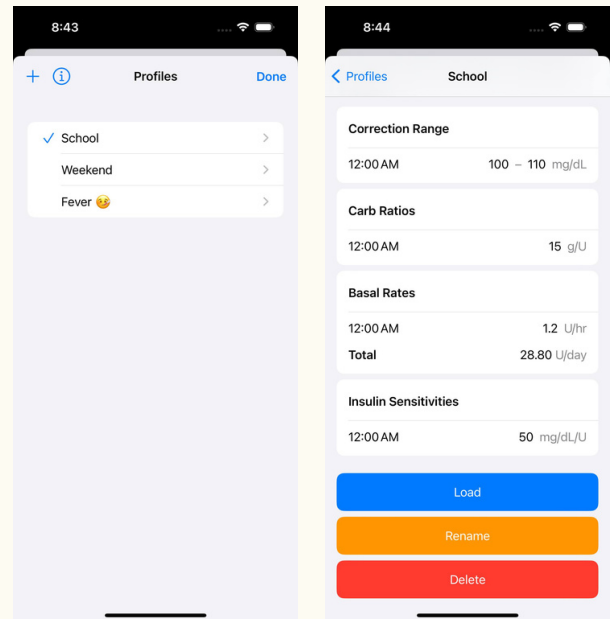

Official Loop Follow Version Now Supports iAPS

We're excited to share that the official Loop Follow app has now been upgraded to support users using iAPS (formerly known as FreeAPS X). A hearty acknowledgment goes to Auggie Fisher, whose pioneering work in a separate fork made this integration feasible.

For our iAPS followers, here's the breakthrough: these features were previously exclusive to LoopFollow and not available in the FAX fork, but are now at your disposal:

• Browser build capability
• Auto-signing
• Automatic workspace selection
• And other LoopFollow features released post the fork
As always, we thrive on feedback and collaboration. Test the waters with the revamped Loop Follow and let the iAPS community know your take!

Building Instructions:

Browser Build   **Mac-Xcode Build**

≫ iOS 17 ≪

Last week, we recommended upgrading to iOS 16.6.1 and WatchOS 9.6.2 for important security updates. We also recommended waiting to update to iOS 17, as it's still in beta and your Loop phone is a medical device. Beta is going well, but we are not changing these recommendations quite yet.
